

Architecture Review

October 2025

DO GREAT THINGS EVERY DAY

Business Context

CoE Vision

Why Now

CoE Objective

- Accelerate business process automation
- Reduce operational inefficiencies
- Enhance customer, advisor, or internal agent's experience
- Lay the foundation for long-term automation scalability and sustainability

Guiding Principles

- Reliable
- Re-usable & Scalable
- Ease of maintenance
- Trackable

What is the plan?

Customer Line

PF & MFC

Product Line

OMP & GL

PAS

BaNCs only

Timeline

- Month 1: Foundation & Planning
- Month 2: Architecture Design
- Month 3: Development Phase 1
- Month 4: Development Phase 2
- Month 5: Development & Transition
- Month 6: Optimize & Closure

Revival-AS IS: with clear funneling criteria, we can define a ‘simple revival’ to fully automate process while removing need for human qualification judgement

Analysis of revival processing workflow

5 primary processes, 10 secondary processes, 34 operation fields, 32% automate opportunity

1、T1-Standardize

Standardize application materials across all channels:

- ① Fields; ② Characters;
- ③ Prior education: Agents and branches must conduct medical re-evaluations for clients with overdue payments exceeding 30 days. Cases exceeding 30 days require a 1-day optimization period.

2、T2-Full STP (8→1)

Full STP simple revival runs through 11 criteria for process qualification, requiring no manual intervention.

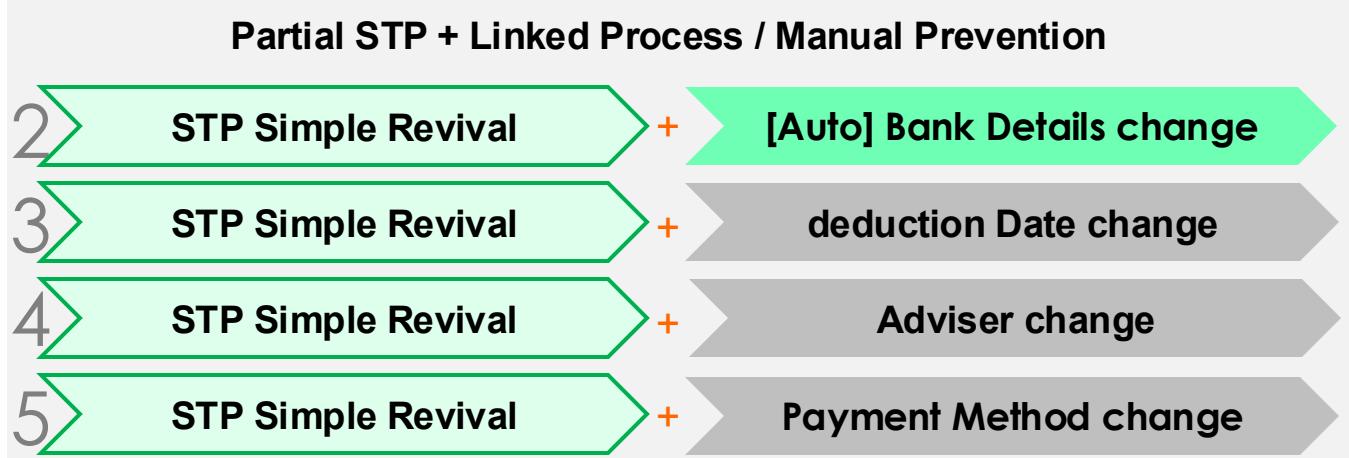

Revival-TO BE: by linking simple revival STP with other automating processes, current estimate suggest up to 46% volume coverage

Revival STP & Conditional Out-Route

Revival Architecture: to-be for Phase 1

Maximizing the reuse of existing assets to deliver quick wins, while building scenario-driven, reusable capabilities for the future

AS-IS: The current Revival process is defined by an extreme "swivel chair" problem.

Phase 1 TO-BE Approach:

- **For "Revival-only" requests**, dedicated Full STP and Partial STP capabilities will be introduced to streamline the common scenarios.
- **For combination requests**, a new classification and routing mechanism will enable modular automation. This allows for the dynamic assembly of the new sub-process with other existing automated sub-processes (e.g., banking info updates), maximizing the reuse of current automation assets

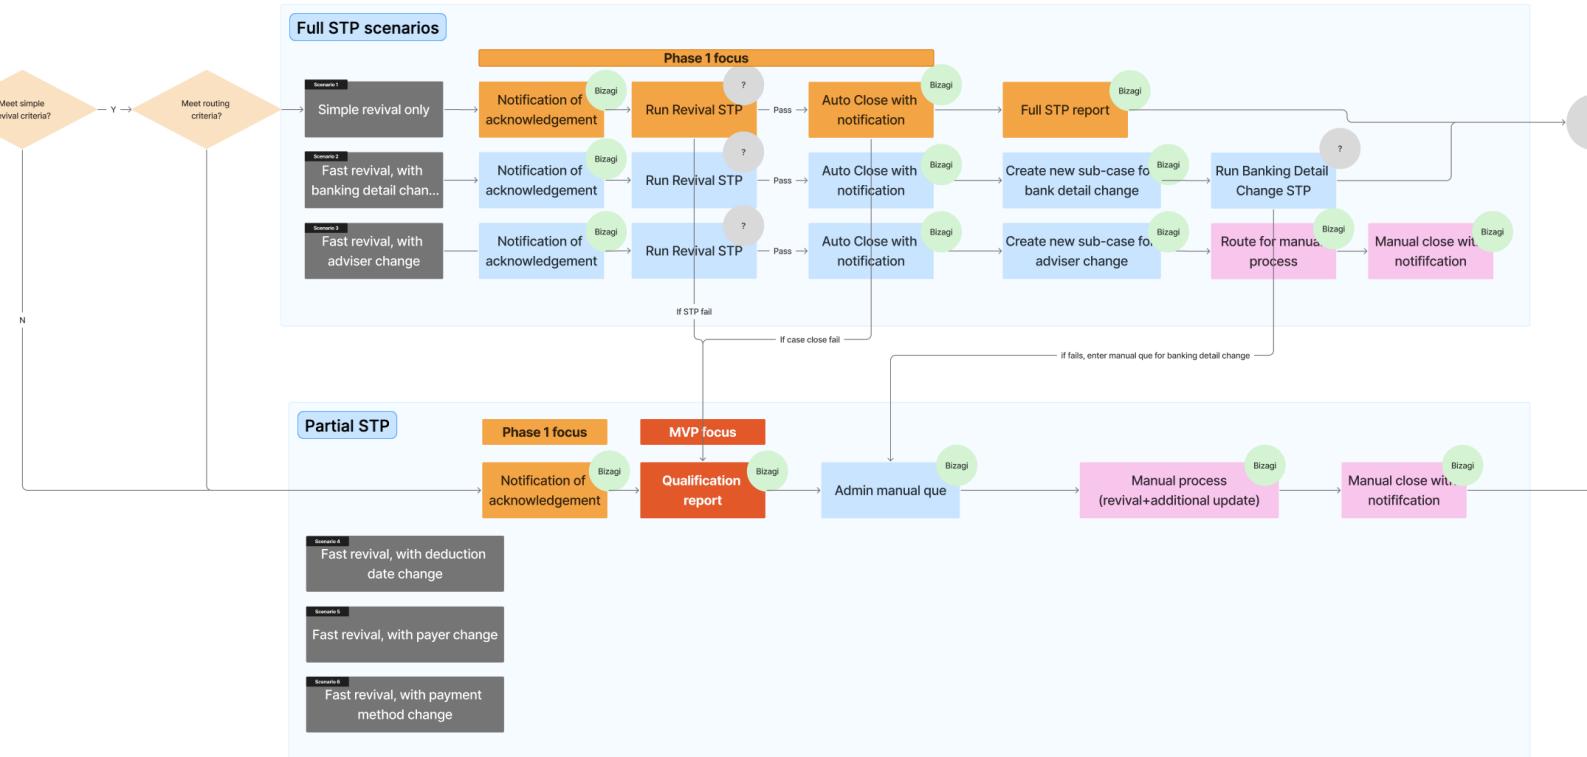

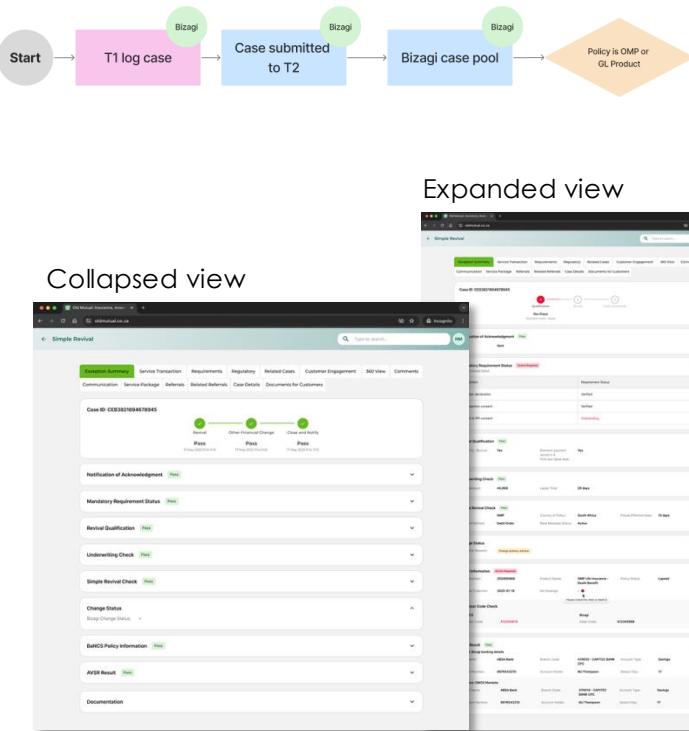

To-be (major change highlight in red)

Revival MVP scope

Based on continuous requirement clarification and resource planning, we have established a phased automation strategy

MVP (Red)

prioritizes automating the manual qualification step by introducing a **Qualification Summary Report**. This report will aggregate cross-system data and automate validation logic, standardizing the process.

Phase 1 (Orange)

will then implement full Straight-Through Processing (STP) for "revival-only" scenarios to reduce manual intervention.

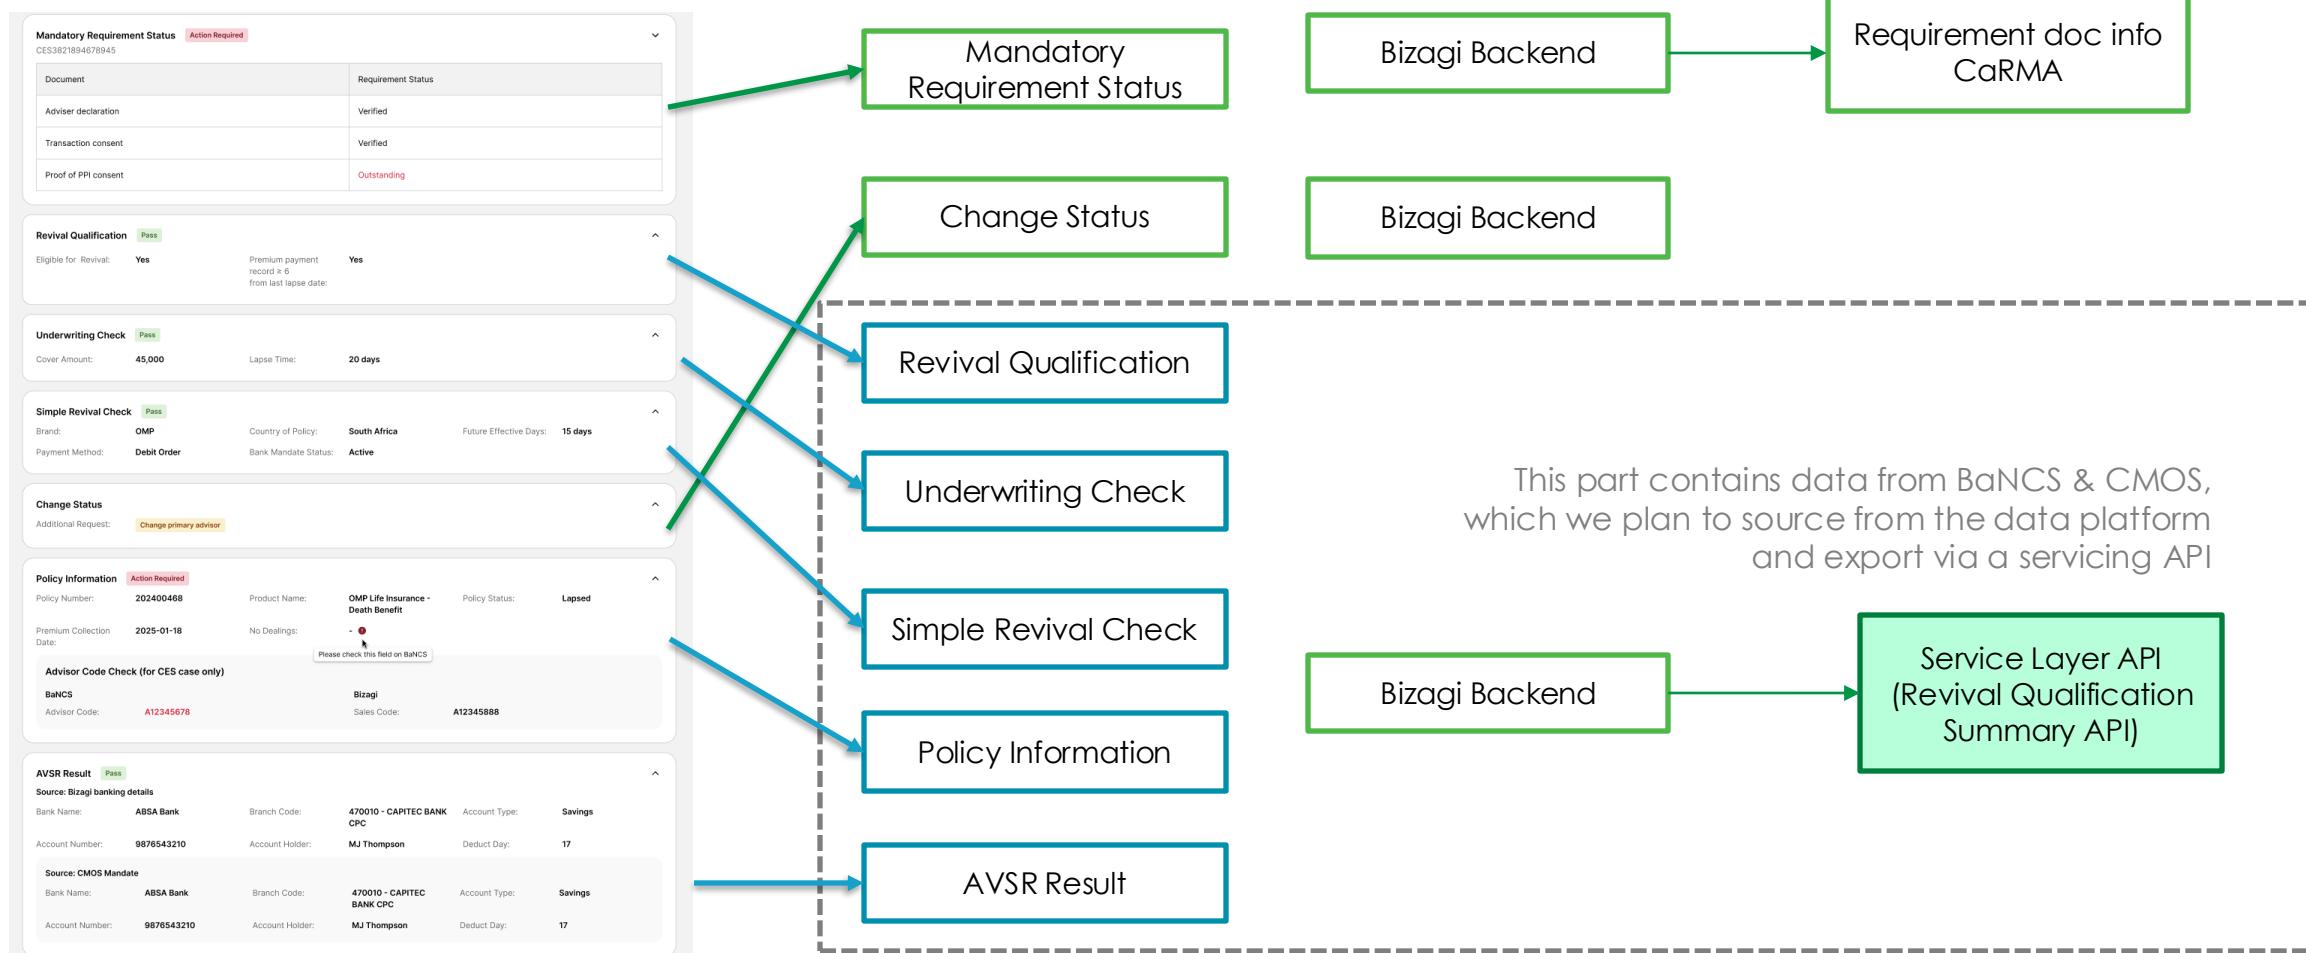

Future phases (Blue)

will expand automation by combining these elements with other process flows.

MVP Implementation Approach

The prototype displays multiple sections for revival qualification summary report.
Each section retrieves its data from different sources as follows:

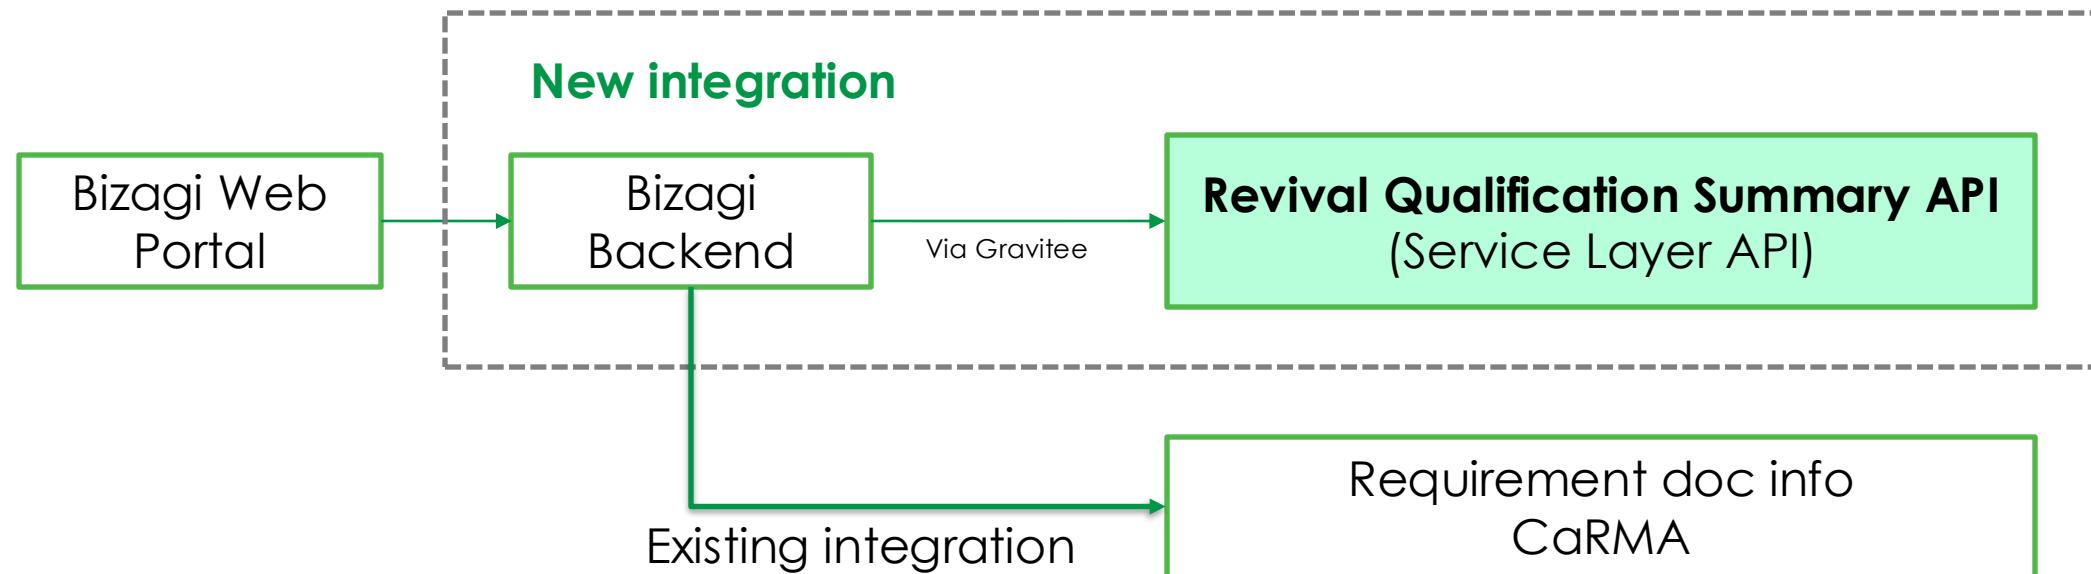

MVP Implementation Approach – Bizagi PoV

Action required:

1. Integrate with Service Layer API for data retrieval & validation
2. Generate report UI

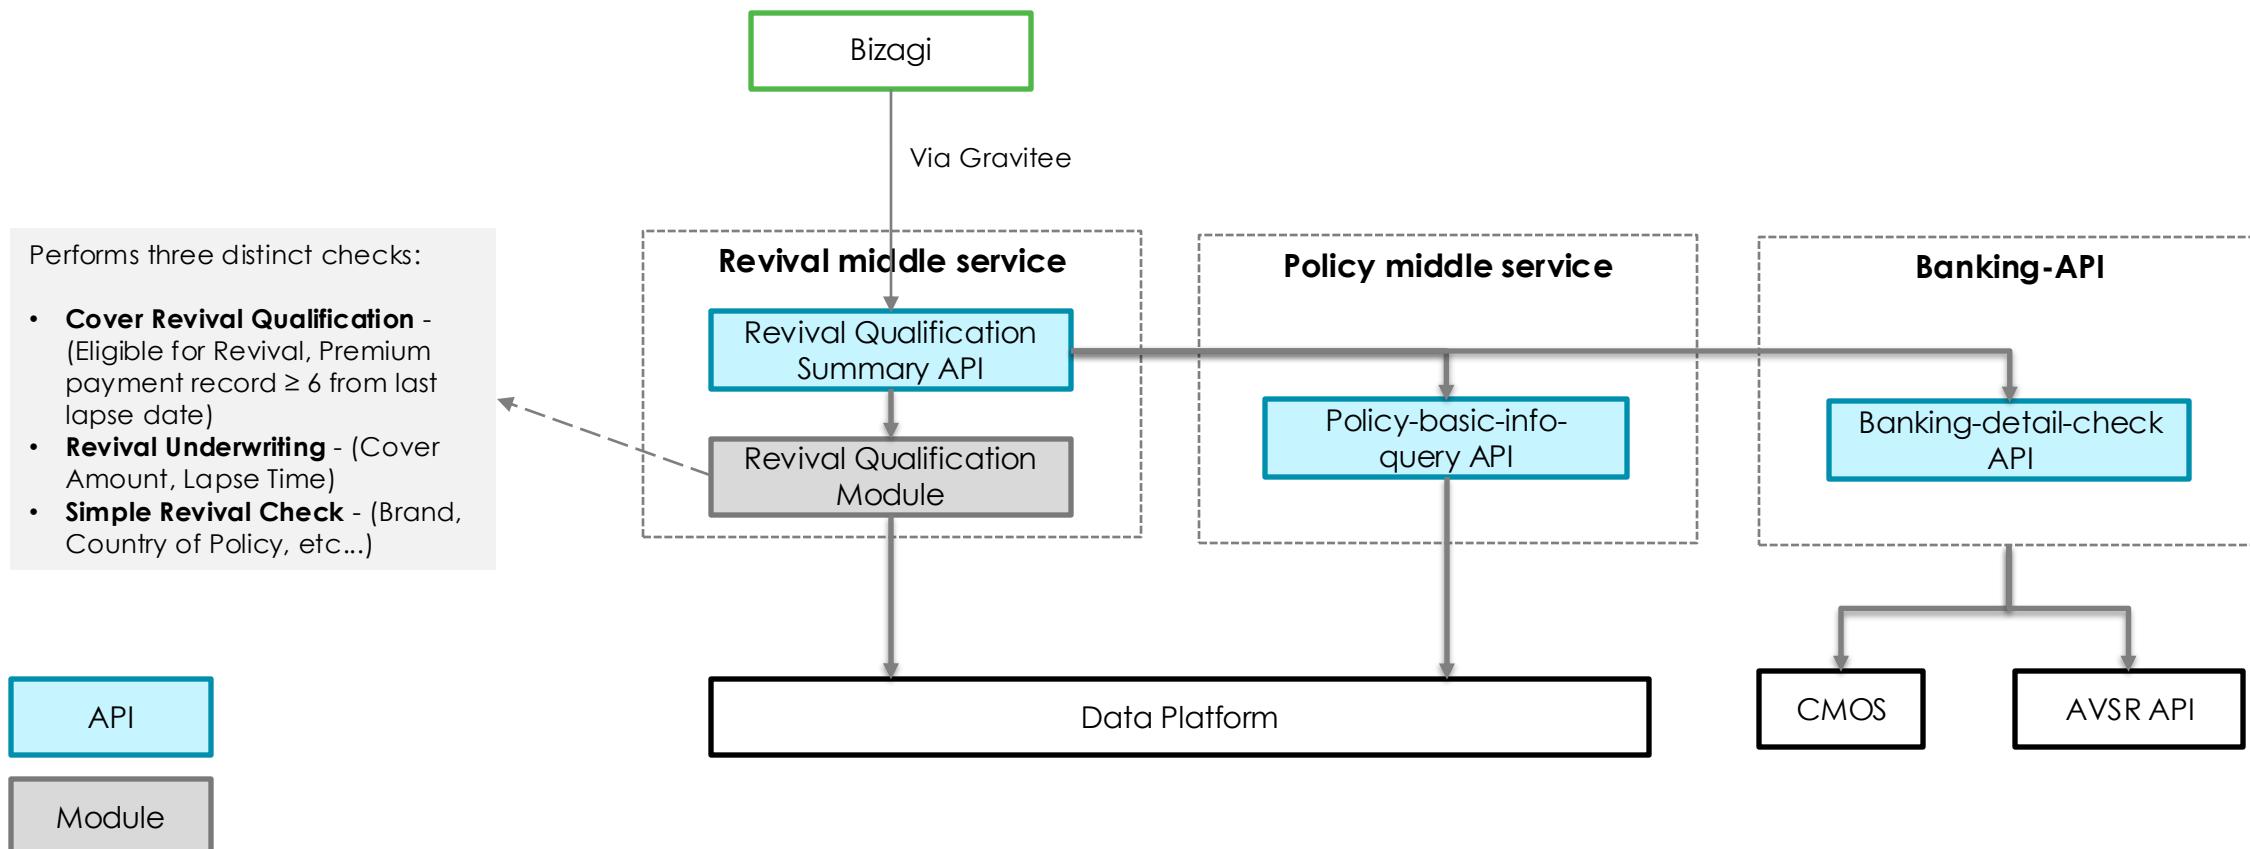

Implementation Approach – Servicing API PoV

Action required:

Development the APIs to support the revival qualification summary report

Servicing API MVP Requirements

API Name	Service	Purpose	Dependencies	Endpoint	Comments
Revival Qualification Summary API	Revival Middle Service	Orchestrates the partial STP qualification check for revival	<ul style="list-style-type: none">• All downstream servicing APIs• Data Platform	/api/revival/policies/{policyNumber}/qualification-summary	Bizagi only need to interact with this one
Policy Basic Info API	Policy Middle Service	Fetch policy basic information	<ul style="list-style-type: none">• Data Platform	/api/policies/{policyNumber}/basic-info/	Further validation would handle in revival-middle-service
Banking Detail Check API	BankingAPI (Sharing same baseURL)	Validate banking details and mandate status	<ul style="list-style-type: none">• CMOS getMandates,• AVSR API	BaseUrl Follow existing endpoint design pattern in Banking API /bank-detail-check	Leverage current capability for CDV, AVSR check and getMandates API

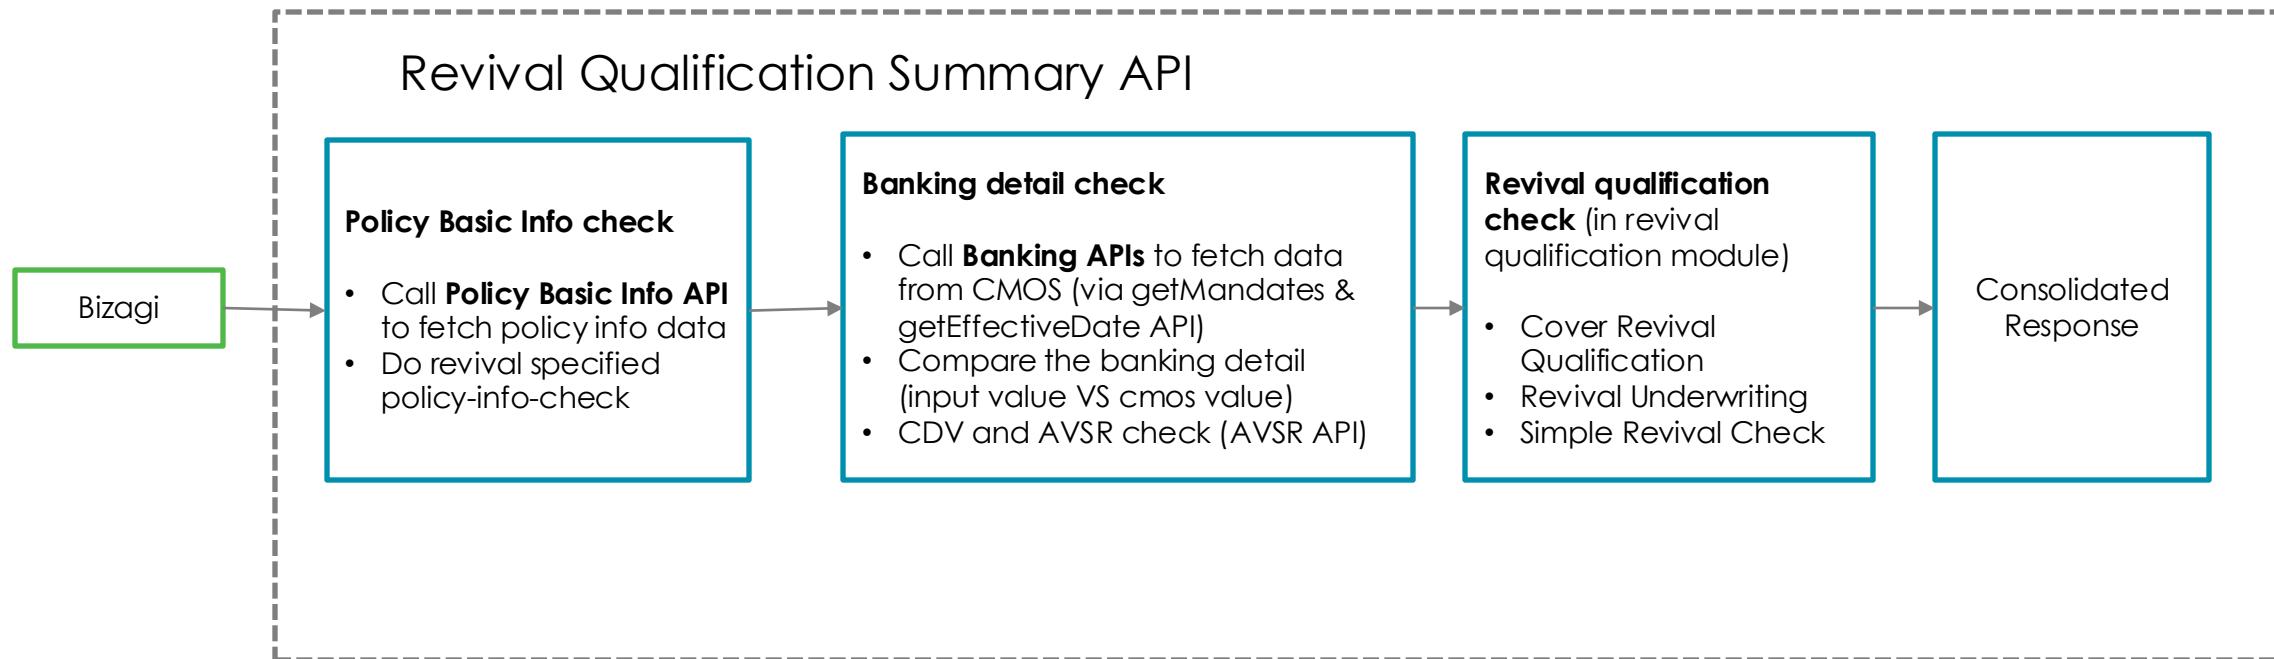

Key Points for Bizagi:

- Bizagi only needs to call Revival Qualification Summary API
- All orchestration logic & rule checking would handle by middle service layer

Revival Qualification Summary API - Execution Sequence

Parking From Jagadish (can replace with time sequence diagram)

Time Sequence Diagram

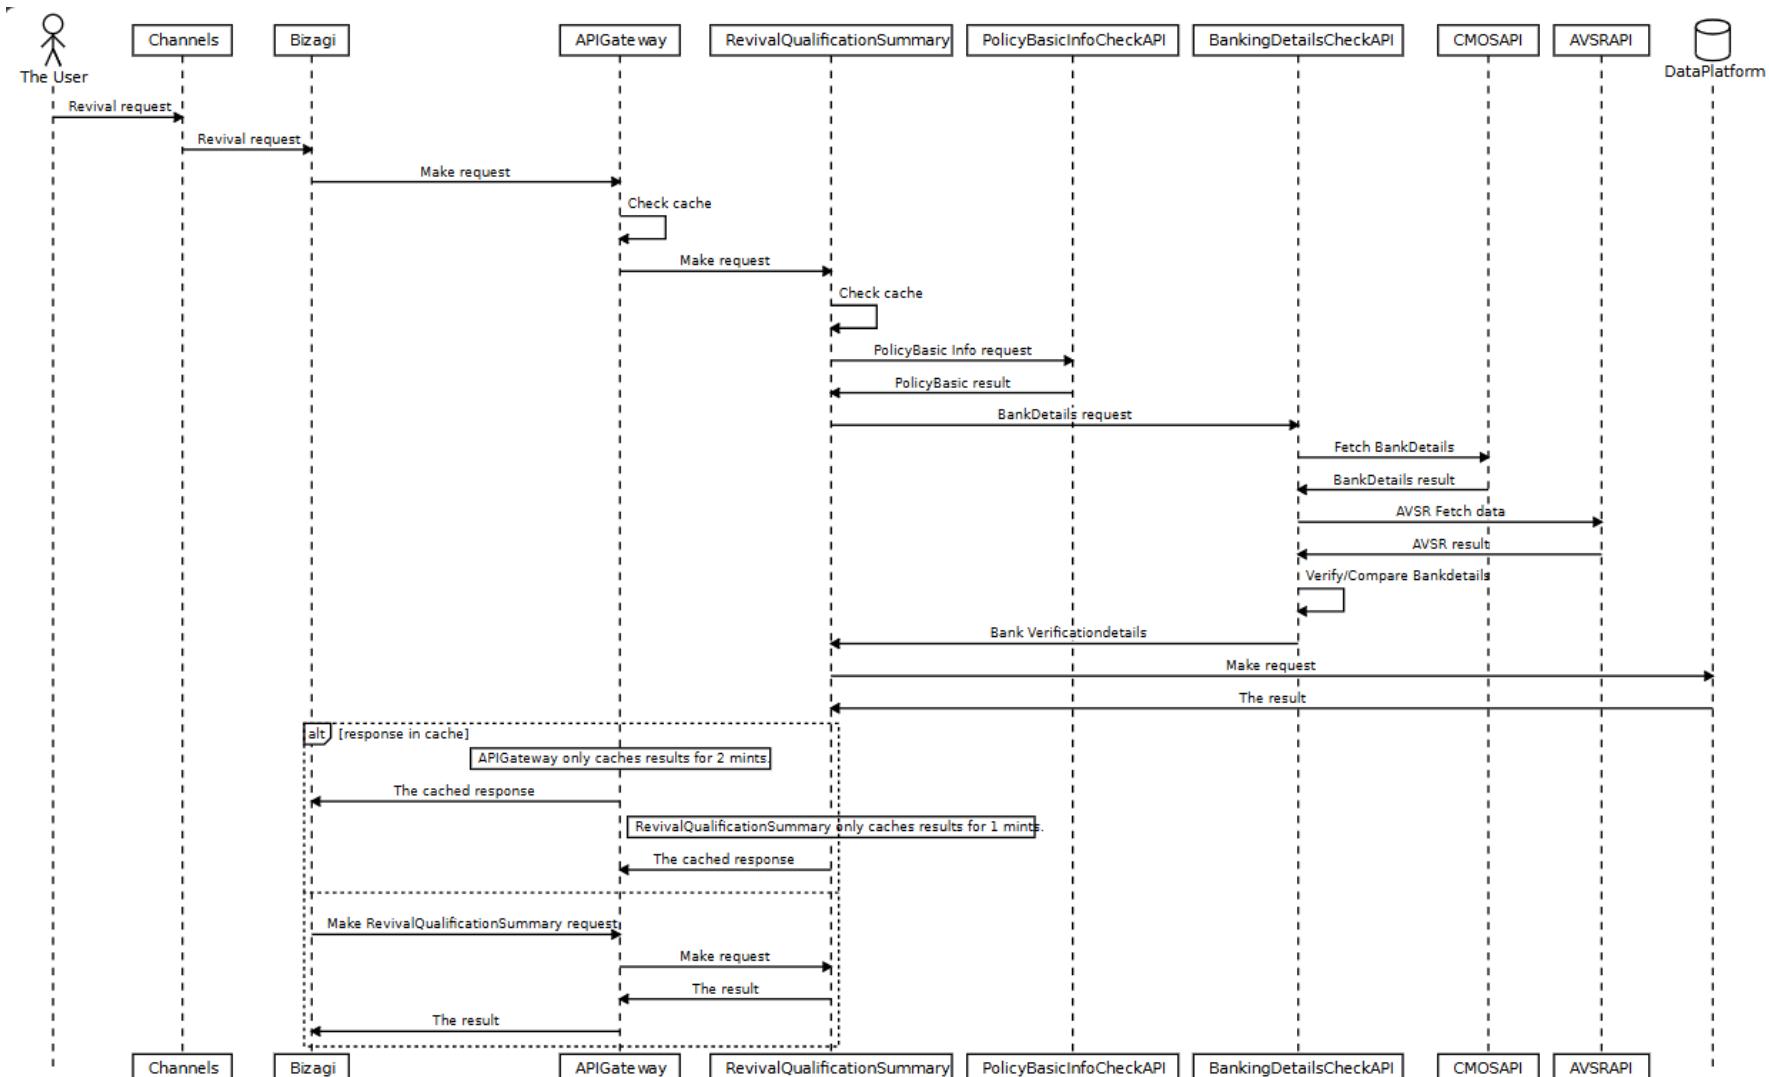

Parking From Jagadish

Could further review the duration for cache which now setting as 1min

Given Revival volume sampling data showing around 39 service request per day and 40% of them are revival-only,

Considering volume is not that high & per request would takes around 20mins to complete,

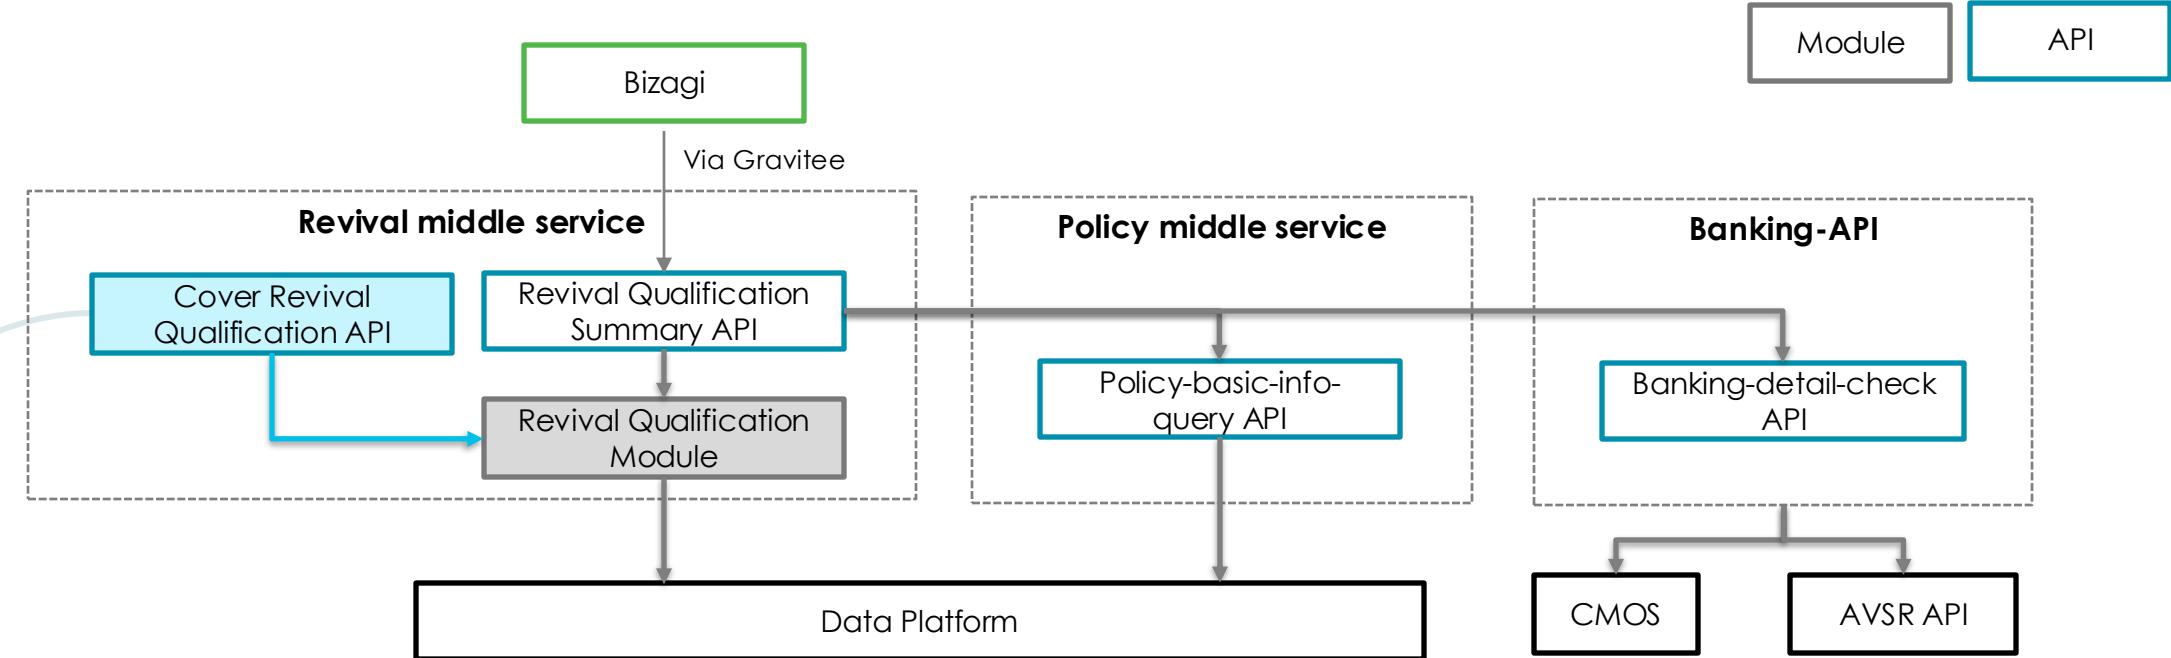

So we could consider to set the cache duration longer(said 20mins or 30mins)?

Evolution Design

Case1 – if T1 need to reuse eligibel check : The Revival Qualification Module can be evolved into a Revival Qualification API in later stages, allowing it to be reused by other consumers.

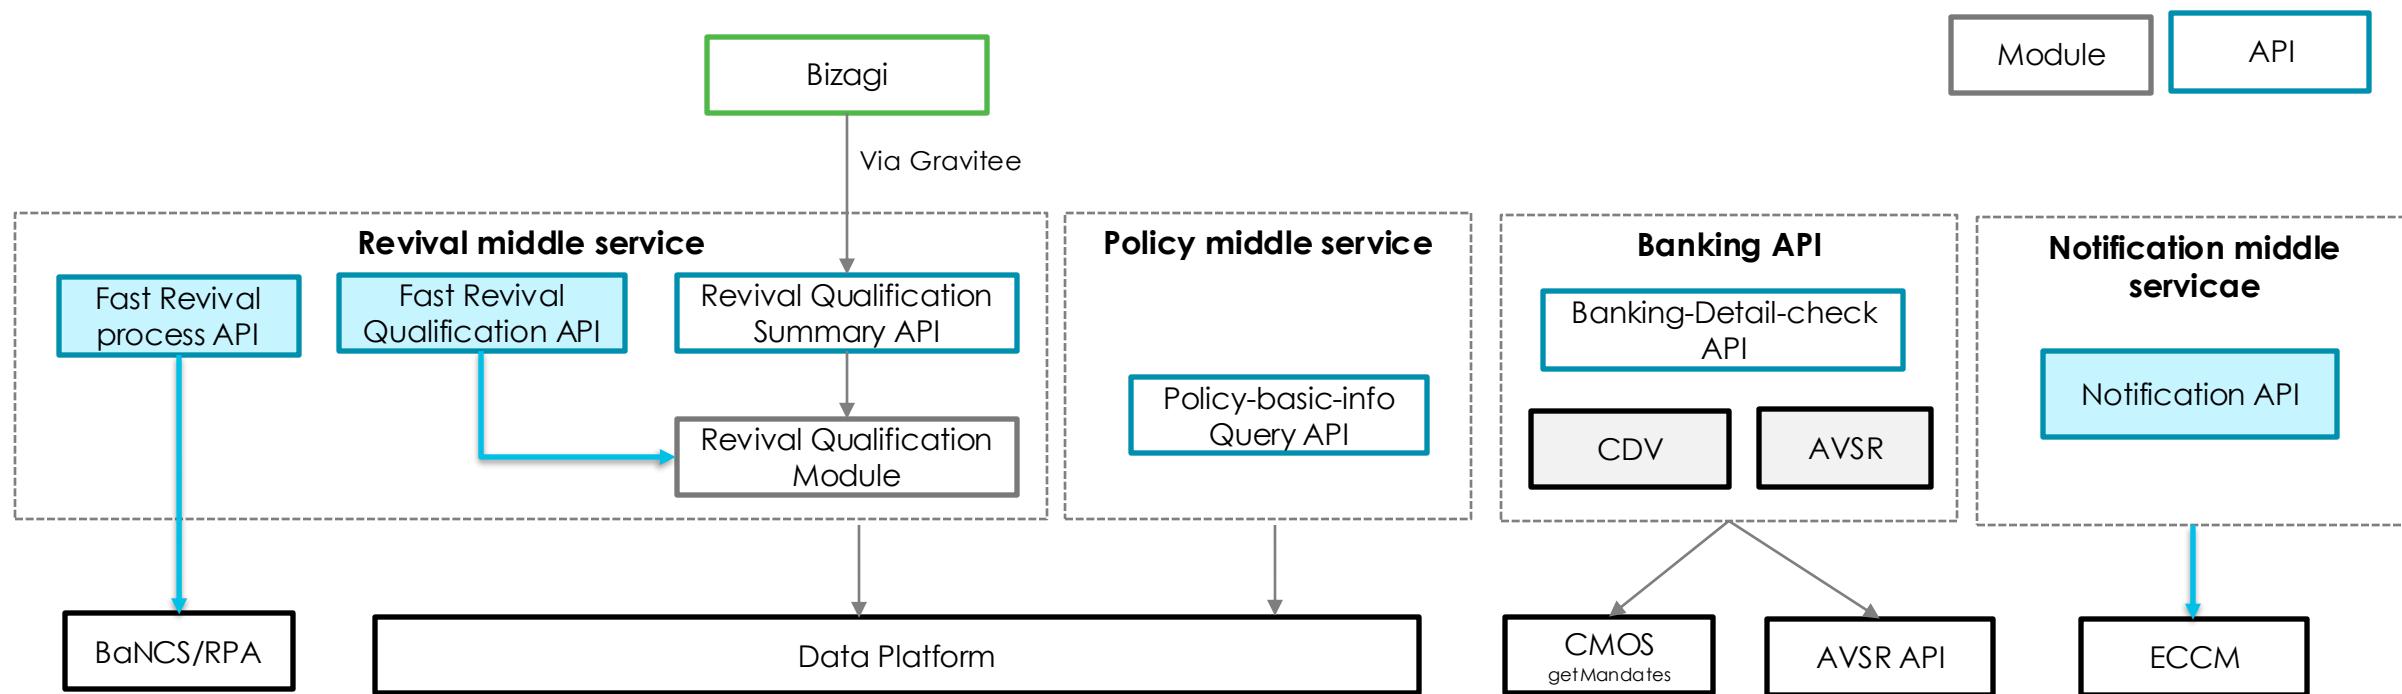

API Name	Service	Purpose	Dependencies	Endpoint	Comments
Revival Qualification API	Revival Middle Service	Performs three distinct checks: - Cover Revival Qualification - Revival Underwriting - Simple Revival Check	Data Platform	/api/policies/{policyNumber}/qualification-check	We could further expose this API if UAW or other system need to reuse these checking

Evolution Design

Case2 – When we need to handle full STP for:

- **FastRevival process API** would be added, and depends on either BaNCS or RPA
- **FastRevival qualification API** would be added, all checker in Revival Qualification Module would be reuse and plus some more data from Bizaigi input for further checking
- **Notification API** would be added, for getting signal from source system(eg.Bizagi), then enrich necessary data & send to ECCM

THANK YOU
